EXPERIENCE

Xanadu

Dec. 2019 - Now

High Performance Computing Specialist

- Developed high performance, parallel C++ codes to simulate massive quantum circuits.
- Helped optimize C++ and python code in several Xanadu libraries (PennyLane, TheWalrus, Jet).

Canadian Institute for Theoretical Astrophysics

Sept. 2013 - Aug. 2019

PhD Researcher in Computational Astrophysics

- Developed next generation numerical methods for solving the Einstein field equations (a non-linear set of partial differential equations) on supercomputers and implemented them in a $\sim 100,000$ -line code available on GitHub.
- Worked on a team (10+developers) to develop a task-based parallelism framework for numerical relativity called SpECTRE, available on GitHub.
- Member of the LIGO collaboration, working on extracting neutrino and matter emission properties from gravitational wave and electromagnetic counterpart signals of binary neutron star mergers.

University of Winnipeg

2009-2013

Summer Research Scientist

- Developed a state-of-art GPU-accelerated (via CUDA) C++ code for the diffusion and collision of water molecules around randomly oriented axons in 3d brain-matter. This was coupled with a numerical solve of the Bloch partial differential equations to obtain the magnetic resonance imaging signal in realistic environments.
- Developed a semi-analytical model for estimating axon distribution properties from magnetic resonance imaging signals.
- Used image-segmentation techniques to study brain changes in mice with different Alzheimer-based gene modifications.
